Overview

The following is a GIS analysis performed for the Williston Conservation Commission (WCC). The Town of Williston, Vermont provides an Environmental Reserve Fund (ERF) with the idea of using money from the Fund for conservation and protection of land throughout the Town. The goal of this particular analysis was to target parcels of privately owned land in Williston that have high ecological and natural value. With this tool, the WCC can have a better idea of how to best allocate funds from the ERF.

Criteria Descriptions

The following are brief descriptions of the data that make up the criterion for the ERF Parcel analysis. Parcels received 1 point for every criteria that they intersected (unless otherwise noted in **bold** below). In the following spreadsheets, these criteria are grouped into three categories: Water, Wildlife, and Land. Parcels with a score between 0-5 were classified as "Low", 6-10 were "Medium", and 11-16 were "High". **All parcels classified as "High" are included in the spreadsheets as well as parcels classified as "Medium" with a score of 9 or 10 and with an area of greater than 10.5 acres.**

*All Data files used in this analysis can be found in the Town of Williston's computer system at: H:\JAndreoletti\GIS Maps\ERF

Water

Wetlands (Wet.) - This data layer was created by the University of Vermont's Spatial Analysis Lab (SAL). The SAL did a land use and land cover (LULC) analysis of Williston in 2009 and identified 13 different classes of land cover. The "Wetlands" class was extracted from the SAL's analysis to be used in this ERF Parcel Analysis.

Named Stream (Stream) - This data was generated by the Vermont Center for Geographic Information (VCGI) and is a part of the Vermont Hydrography Dataset. It displays all named streams in Williston, consisting of the Allen, Muddy, and Sucker Brooks, as well as the Winooski River.

Tributary (Trib) – These tributaries are defined as unnamed perennial or intermittent streams identified on the 7.5' U.S. Geological Survey quadrangles covering the town, or on the Williston Field Stream Survey maps of the Allen and Muddy Brook watersheds prepared by the Vermont Department of Environmental Conservation.

Named Stream Buffer (S. Buf) – Section 29.9.2.1 of the Town Bylaw states that there shall be a buffer of at least 150 feet around the Muddy, Sucker, and Allen Brooks, as well as the Winooski River.

Tributary Buffer (T. Buf) – Section 29.9.2.2 of the Town Bylaw states that there shall be a buffer of at least 50 feet around all unnamed streams – perennial or intermittent - identified on the 7.5' U.S. Geological Survey quadrangles covering the town, or on the Williston Field Stream Survey maps of the Allen and Muddy Brook watersheds prepared by the Vermont Department of Environmental Conservation.

Wildlife

Core Forest Habitat (C. For) – A Core Wildlife Habitat is defined as a combination of several different wildlife habitat types combined to form a unit of relatively continuous wildlife habitat. Areas characterized as Core Habitat generally consist of relatively large forested areas that might contain a combination of early succession habitats, forested riparian areas, wetlands and vernal pools, deer wintering areas (i.e. deeryards), mast stands; ledge, talus, or cliff habitats; and habitat identified by the Vermont Department of Fish and Wildlife as either significant wildlife habitat or necessary wildlife habitat in accordance with 10 V.S.A. Sec. 6086(a)(8)(A). This analysis only includes Core Wildlife Habitat classified as Core Forest and Edge Forest since other types of Core Wildlife Habitat (Wetlands and Agricultural Fields) are accounted for in other criteria. The Core Wildlife Habitat data is from a 2001 SAL analysis titled, "An Assessment of Wildlife Habitat in Williston, Vermont: Expanded Land cover Mapping and Corridor Modeling."

Wildlife Corridor (W.C.)- Wildlife Corridors are defined as routes that permit the direct travel or spread of animals or plants from one area or region to another, either by the gradual spread of a species' population along the route or by the movement of individual members of the species. Generally, such areas are characterized by undeveloped forested and riparian corridors, including forest cover reaching to road rights-of-way, which serve to link large tracks of unfragmented core habitat. This data also comes from the above mention SAL wildlife document.

Uncommon Species (U Spp) – These vulnerable species are at moderate risk of extinction\extirpation due to restricted range, relatively few populations or occurrences (often 80 or fewer), recent and widespread declines, or other factors. Uncommon Species data used in this analysis came from the Vermont Fish and Wildlife Department.

Rare, Threatened, and Endangered Species (RTE Spp) – Rare species are defined as imperiled species that are at high risk of extinction or extirpation due to very restricted range, very few populations (often 20 or fewer), steep declines, or other factors. Rare species face threats from development of their habitat, harassment, collection, and suppression of natural processes, such as fire. Endangered and threatened species are defined by both state and federal law. State law defines endangered species as "a species listed on the state endangered species list under {10 V.S.A. Chap. 123 section 5401} or determined to be an 'endangered species' under the federal Endangered Species Act. The term generally refers to species whose continued existence as a viable component of the state's wild fauna or flora is in jeopardy. Threatened species are defined in 10 V.S.A. Chap. 123 section 5402 as a species whose numbers are significantly declining because of loss of habitat or human disturbance, and unless protected will become an endangered species. This data also came from the Vermont Fish and Wildlife Department.

Land

Proposed Path (Path) – Chapter 8 of the Town Plan defines paths as links between neighborhoods that are designed to accommodate a broad range of non-motorized uses such as biking and rollerblading. Proposed Path data comes from 2011 Town Plan. This data is updated annually.

Proposed Trail (Trail) –Chapter 8 of the Town Plan defines this shapefile as a low-maintenance primitive trail network which provides hiking, skiing, and where appropriate, mountain biking opportunities in Williston's rural landscape. Proposed Trail data comes from 2011 Town Plan. This data is updated annually.

Slope > 30% (Slope) – All regions with a slope greater than 30% are displayed in this shapefile. The bylaw prohibits development on slopes greater than 30%. Lands with slopes greater than 30% are also excluded from the land area which is used to calculate density. Slope data is from the Chittenden County·Region Planning Commission.

Unique Natural Communities (U.N.C.) – The Unique Natural Communities shapefile is fairly self explanatory, as it displays unique natural communities. An example of such would be the glacial spillway located near Old Creamery Road. This data is from the 2011 Town Plan as well and is updated annually.

Undeveloped (Undvlp) - All parcels that had an address were identified as developed and all parcels that did not have an address were identified as undeveloped. The Undeveloped Parcel data was developed from an analysis of the Williston Address shapefile and Williston Town Parcels shapefile. **Undeveloped parcels received a score of 2 points. Developed parcels that were greater than 10.5 acres got a score of 1 point.**

Potential Trail Link (P.T.L.) - Potential Trail Link data identifies parcels that could connect existing trails and conservation easements. Potential Trail link parcels were identified by doing a visual analysis of the Existing Trails/Easements shapefile and Williston Town Parcels shapefile.

Adjacent to Conserved or Excluded Land (A.C.E.L.) – Parcels that met this criteria were adjacent to Conserved or Excluded Land. The Conserved Land shapefile (new) is a merge of the Open Space parcels created as a requirement of subdivision and Conserved Land (land which is held by a 3rd party conservation easement) shapefiles created by the Town of Williston. Excluded Land was identified as parcels that were owned by the State of Vermont, the Town of Williston, or the Town of Williston's Schools.

LESA – LESA (Land Evaluation and Site Assessment) is an index used to determine the agricultural value of a piece of land. The Land Evaluation (LE) portion of LESA is based on a 0-100 scale and is used to determine the productivity of soil. The Site Assessment (SA) portion of LESA is based on a 0-200 scale and is used to determine how suitable a site is for agricultural development. Several factors go into this analysis, including local agricultural land use, local zoning laws, available resources, and potential environmental impacts. The sum of the Land Evaluation and Site Assessment portions is a total LESA value, with a maximum value of 300. In this analysis, parcels with a LESA value **less than 120 were given 1 point,** and parcels with a value of **greater than 120 were given 2 points.** Parcels that received 0 points were identified in the LESA evaluation as land not suitable for agricultural use. LESA data comes from a 1988 study.

Viewshed (Vshed) – The Viewshed criteria was developed from the Focal Points shapefile and the Visual Assessment layer prepared by the Chittenden County Regional Planning Commission (CCRPC). Focal Points can be described as aesthetically pleasing regions one would focus on while on a hike (such as Brownell Mountain). From the Visual Assessment layer, regions classified as "Primary Background/Horizon" were extracted and used for this analysis. Viewshed data comes from a 1989 study done for the 1990 Town Plan.
